S3 Appendix: Supplementary results

Figure 1: **Benchmarking settings for computational performance.** Settings are compared with the *cat* configuration. Horizontal bars are the geometric-mean relative difference under each setting.
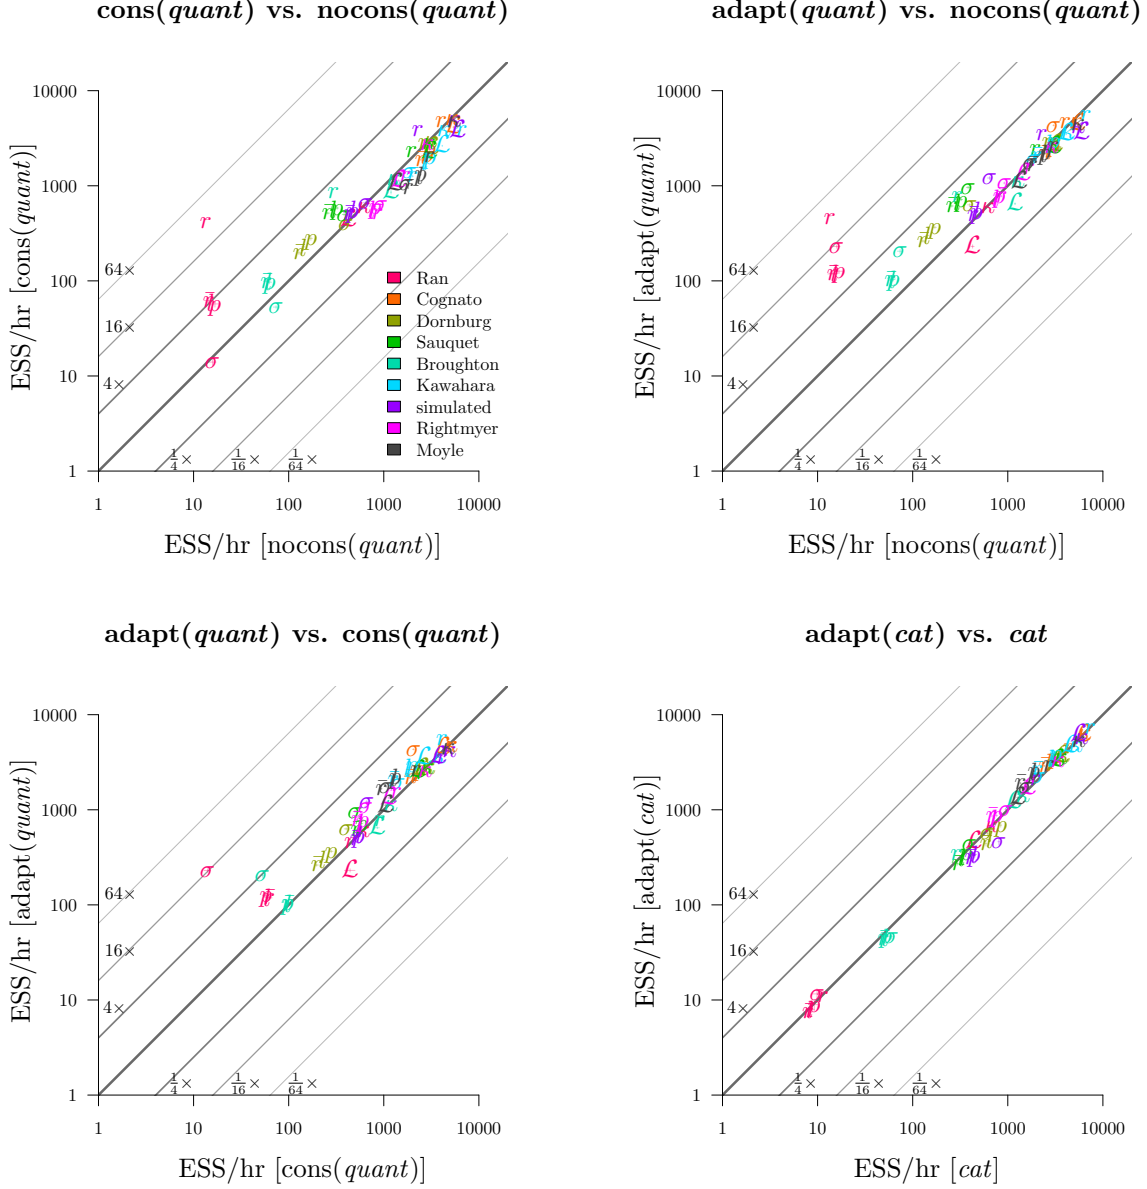

Figure 2: **Round 1: Performance evaluation of** `AdaptiveOperatorSampler` **under the *quant* and *cat* parameterisations.** These results show that *cat* does not benefit from adaptive weight sampling. Whereas, adapt and cons both greatly improve the *quant* parameterisation for most datasets, as expected.
